Summary

Software engineer and final-year CS student who builds and deploys production AI systems with end to end agentic workflows, RAG pipelines, and document/media automation. Passionate about continuous learning and eager to grow into an AI engineering role while delivering reliable, real-world systems.

Experience

Software Engineer, Appcraft

Feb 2026 – Present

- Develop new features and resolve bugs across a production codebase spanning backend services and a React-based admin dashboard.
- Build and maintain backend APIs using FastAPI, supporting application features and admin operations.
- Collaborate on feature delivery, debugging, and ongoing improvements to a live product.

Projects

SpeechFindr — AI Media Transcription Platform (Final Year Project)

[Live Demo](#) — [Code](#)

- Built an AI web app that converts YouTube videos and uploaded media into searchable, timestamped transcripts with summaries, chapters, Q&A, translation, and text-to-speech.
- Engineered a cascading transcription pipeline (native captions → auto-captions → Groq Whisper), with parallel chunked processing and SHA-256 caching for fast re-runs.
- Layered LLM features (Groq LLaMA) and a lightweight term-frequency RAG for cited Q&A; added multilingual translation and Edge-TTS narration with live progress streaming.

Restaurant AI Assistant (LangGraph Agent)

[Live Demo](#) — [Code](#)

- Built a multi-intent AI agent with LangGraph that handles restaurant reservations, orders, and menu queries via conditional routing between specialized handlers.
- Implemented real-time availability checking against capacity limits with a human-in-the-loop confirmation flow to prevent invalid bookings.
- Integrated Retrieval-Augmented Generation (ChromaDB) for menu and FAQ answers; deployed a FastAPI backend and React frontend to production with rate limiting and conversation logging.

AI Invoice Data Extractor

[Live Demo](#) — [Code](#)

- Built a tool that extracts structured data (vendor, line items, totals) from PDF and scanned invoices using OpenAI models with Pydantic-validated output.
- Implemented an automated validation layer that verifies totals and flags low-confidence extractions for human review.
- Generated clean, formatted Excel output; containerized with Docker and deployed to production.

Technical Skills

Languages: Python, JavaScript, SQL

AI / ML: LangChain, LangGraph, RAG, FAISS, ChromaDB, Pydantic, Scikit-learn, TensorFlow, Claude

Frameworks: FastAPI, React.js, React Native, Node.js, Streamlit

Data: Pandas, NumPy, Matplotlib, Seaborn

Databases: PostgreSQL, MySQL, MongoDB

Tools & Deployment: Git, GitHub, Docker, Railway, Supabase, Vercel

Education

Iqra University, Karachi

Expected Graduation: July 2026

Bachelor of Science in Computer Science (BSCS)

CGPA: 3.4

Relevant Coursework: Machine Learning, Generative AI, Data Science, Software Engineering, Web Development

Areas of Interest

Agentic AI, Generative AI, RAG Systems, Backend Development, Full-Stack Development
